

Aircraft Mover TUG SOLD!!!!

This aircraft mover was originally designed to be able to lower the tail on an aircraft to clear low hanger doors, but has gone through several upgrades, and has towbar provisions and flexibility to work with a variety of aircraft. Depending on your location you can use either a hard tire or pneumatic tire fork lift, readily available locally used at very attractive prices.

The accompanying pictures show it used to move both long and short body MU2 aircraft, which are difficult due to the dual nose wheels, and the setback on the long body MU2.

The front area is designed to be adjustable for a large variety of aircraft, both single and dual nose wheel designs, and of various sizes.

This unit has been used for a demo on my aircraft and for testing. We are offering a substantial discount for this one.

Call or email for further details.
